

WHAT IS CLAIMED IS:

1. A radiation image acquisition apparatus, comprising:
a sensor for spatially sampling a radiation
transmission distribution of an object to be imaged at a
5 spatial sampling interval and acquiring an image of said
object; and
a scattered ray removing grid for removing scattered
rays from said object,
wherein an interval of elements of said scattered ray
10 removing grid is set such that a spatial frequency of a
stripe pattern, in said image, which originates from said
scattered ray removing grid becomes not less than $1/3$ and
not greater than 40% of a sampling frequency that is a
reciprocal of said spatial sampling interval.
- 15 2. The apparatus according to claim 1, wherein said
scattered ray removing grid is used without being moved
during acquisition of said image by said sensor.
3. The apparatus according to claim 1, further
comprising an image processing unit for removing said
20 stripe pattern which originates from said scattered ray
removing grid by filtering said image.
4. The apparatus according to claim 3, wherein said
image processing unit performs said removing in accordance
with operation performed by an operator.
- 25 5. The apparatus according to claim 3, wherein said
image processing unit performs said removing in accordance
with an application purpose of said image.

6. The apparatus according to claim 5, wherein said image processing unit performs said removing if the purpose is to perform spatial frequency emphasis processing for said image.
- 5 7. The apparatus according to claim 5, wherein said image processing unit performs no said removing if the purpose is to perform display or hard copy operation of said image on a scale not less than 100%.
8. The apparatus according to claim 5, wherein said
10 image processing unit performs said removing if the purpose is to perform display or hard copy operation of said image upon reduction of said image.
9. The apparatus according to claim 5, wherein said image processing unit performs no said removing if the
15 purpose is to store said image.
10. The apparatus according to claim 3, wherein said image processing unit performs said removing in accordance with a portion to be imaged of said object.
11. The apparatus according to claim 10, wherein said
20 image processing unit performs no said removing if the portion is a bone portion.
12. The apparatus according to claim 10, wherein said image processing unit performs no said removing if the portion is a pelvis or joint portion.
- 25 13. The apparatus according to claim 10, wherein said image processing unit performs said removing if the portion is a chest or abdominal portion.

14. The apparatus according to claim 3, wherein said image processing unit performs said removing in accordance with an amplitude of said stripe pattern.

15. The apparatus according to claim 14, wherein said
5 image processing unit performs said removing if the amplitude of said stripe pattern is larger than a predetermined threshold.

16. A radiation image acquisition method of spatially sampling a radiation transmission distribution of an object
10 to be imaged at a spatial sampling interval and acquiring an image of said object using a sensor and a scattered ray removing grid for removing scattered rays from said object, comprising:

setting an interval of elements of said scattered ray
15 removing grid such that a spatial frequency of a stripe pattern, in said image, which originates from said scattered ray removing grid becomes not less than $1/3$ and not greater than 40% of a sampling frequency that is a reciprocal of said spatial sampling interval.

20 17. The method according to claim 16, wherein said scattered ray removing grid is used without being moved during acquisition of said image by said sensor.

18. A radiation image acquisition apparatus, comprising:
a sensor for spatially sampling a radiation
25 transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object; and

a scattered ray removing grid for removing scattered rays from said object,

wherein an interval of elements of said scattered ray removing grid is set such that a spatial frequency that is
5 a reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+1/3) \sim fs(n+0.4)$ or $fs(n+0.6) \sim fs(n+2/3)$, where $1/fs$ is said spatial sampling interval and n is an integer not less than 0.

19. The apparatus according to claim 18, wherein said
10 scattered ray removing grid is used without being moved during acquisition of said image by said sensor.

20. A radiation image acquisition method of spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring
15 an image of said object using a sensor and a scattered ray removing grid for removing scattered rays from said object, comprising:

setting an interval of elements of said scattered ray removing grid such that a spatial frequency that is a
20 reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+1/3) \sim fs(n+0.4)$ or $fs(n+0.6) \sim fs(n+2/3)$, where $1/fs$ is said spatial sampling interval and n is an integer not less than 0.

21. The method according to claim 20, wherein said
25 scattered ray removing grid is used without being moved during acquisition of said image by said sensor.

22. A radiation image acquisition apparatus, comprising:

an image acquisition unit for spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval and acquiring an image of said object;

an image processing unit for removing a stripe pattern originating from said scattered ray removing grid from said image by image processing; and

a selection unit for allowing selection between removal and nonremoval of said stripe pattern by using said image processing unit, wherein the selection is performed in accordance with an application purpose.

23. The apparatus according to claim 22, wherein said image processing unit removes said stripe pattern by filtering.

24. The apparatus according to claim 22, wherein said selection unit selects between removal and nonremoval of said stripe pattern in accordance with operation performed by an operator.

25. The apparatus according to claim 22, wherein said selection unit selects removal of said stripe pattern if the purpose is to perform spatial frequency emphasis processing for said image.

26. The apparatus according to claim 22, wherein said selection unit selects nonremoval of said stripe pattern if the purpose is to perform display or hard copy operation of said image on a scale not less than 100%.

27. The apparatus according to claim 22, wherein said selection unit selects removal of said stripe pattern if the purpose is to perform display or hard copy operation of said image upon reduction of said image.

5 28. The apparatus according to claim 22, wherein said selection unit selects nonremoval of said stripe pattern if the purpose is to store said image.

29. A radiation image acquisition apparatus, comprising:
an image acquisition unit for spatially sampling a
10 radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval and acquiring an image of said object;

an image processing unit for removing a stripe
15 pattern originating from said scattered ray removing grid from said image by image processing; and

a selection unit for allowing selection between removal and nonremoval of said stripe pattern by using said image processing unit, wherein the selection is performed
20 in accordance with a portion to be imaged of said object.

30. The apparatus according to claim 29, wherein said selection unit selects nonremoval of said stripe pattern if the portion is a bone portion.

31. The apparatus according to claim 29, wherein said
25 selection unit selects nonremoval of said stripe pattern if the portion is a pelvis or joint portion.

32. The apparatus according to claim 29, wherein said

selection unit selects removal of said stripe pattern if the portion is a chest or abdominal portion.

33. A radiation image acquisition apparatus, comprising:

an image acquisition unit for spatially sampling a
5 radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval and acquiring an image of said object;

an image processing unit for removing a stripe
10 pattern originating from said scattered ray removing grid from said image by image processing; and

a selection unit for allowing selection between removal and nonremoval of said stripe pattern by using said image processing unit, wherein the selection is performed
15 in accordance with an amplitude of said stripe pattern.

34. The apparatus according to claim 33, wherein said selection unit selects removal of said stripe pattern if the amplitude of said stripe pattern is larger than a predetermined threshold.

20 35. A radiation image acquisition apparatus, comprising:

an image acquisition unit for spatially sampling a radiation transmission distribution on an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling
25 interval and acquiring an image of said object;

an image processing unit for removing a stripe pattern originating from said scattered ray removing grid

from said image by image processing; and

a selection unit for allowing selection between removal and nonremoval of said stripe pattern by using said image processing unit, wherein the selection is performed
5 in accordance with a magnitude of contrast of said stripe pattern.

36. A radiation image acquisition method, comprising:

a step of spatially sampling a radiation transmission
distribution of an object to be imaged through a scattered
10 ray removing grid for removing scattered rays from said object at a spatial sampling interval and acquiring an image of said object;

a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray
15 removing grid from said image by image processing, wherein the selection is performed in accordance with an application purpose; and

a step of removing said stripe pattern by image processing in accordance with the selection.

20 37. A radiation image acquisition method, comprising:

a step of spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval and acquiring an image
25 of said object;

a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray

removing grid from said image by image processing, wherein the selection is performed in accordance with a portion to be imaged of said object; and

5 a step of removing said stripe pattern by image processing in accordance with the selection.

38. A radiation image acquisition method, comprising:

a step of spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said
10 object at a spatial sampling interval and acquiring an image of said object;

a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray removing grid from said image by image processing, wherein
15 the selection is performed in accordance with an amplitude of said stripe pattern; and

a step of removing said stripe pattern by image processing in accordance with the selection.

39. A radiation image acquisition method, comprising:

20 a step of spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval and acquiring an image of said object;

25 a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray removing grid from said image by image processing, wherein

the selection is performed in accordance with a magnitude of contrast of said stripe pattern; and

a step of removing said stripe pattern by image processing in accordance with the selection.

5 40. A radiation image processing apparatus for processing an image acquired by spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling
10 interval, comprising:

an image processing unit for removing a stripe pattern originating from said scattered ray removing grid from said image by image processing; and

a selection unit for allowing selection between
15 removal and nonremoval of said stripe pattern by using said image processing unit, wherein the selection is performed in accordance with an application purpose.

41. A radiation image processing apparatus for processing an image acquired by spatially sampling a
20 radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

an image processing unit for removing a stripe
25 pattern originating from said scattered ray removing grid from said image by image processing; and

a selection unit for allowing selection between

removal and nonremoval of said stripe pattern by using said image processing unit, wherein the selection is performed in accordance with a portion to be imaged of said object.

42. A radiation image processing apparatus for

5 processing an image acquired by spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

10 an image processing unit for removing a stripe pattern originating from said scattered ray removing grid from said image by image processing; and

a selection unit for allowing selection between removal and nonremoval of said stripe pattern by using said
15 image processing unit, wherein the selection is performed in accordance with an amplitude of said stripe pattern.

43. A radiation image processing apparatus for

processing an image acquired by spatially sampling a radiation transmission distribution of an object to be
20 imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

an image processing unit for removing a stripe pattern originating from said scattered ray removing grid
25 from said image by image processing; and

a selection unit for allowing selection between removal and nonremoval of said stripe pattern by using said

image processing unit, wherein the selection is performed in accordance with a magnitude of contrast of said stripe pattern.

44. A radiation image processing method of processing an
5 image acquired by spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

10 a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray removing grid from said image by image processing, wherein the selection is performed in accordance with an application purpose; and

15 a step of removing said stripe pattern by image processing in accordance with the selection.

45. A radiation image processing method of processing an image acquired by spatially sampling a radiation transmission distribution of an object to be imaged through
20 a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray removing grid from said image by image processing, wherein
25 the selection is performed in accordance with a portion to be imaged of said object; and

a step of removing said stripe pattern by image processing in accordance with the selection.

46. A radiation image processing method of processing an image acquired by spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray removing grid from said image by image processing, wherein the selection is performed in accordance with an amplitude of said stripe pattern; and

a step of removing said stripe pattern by image processing in accordance with the selection.

47. A radiation image processing method of processing an image acquired by spatially sampling a radiation transmission distribution of an object to be imaged through a scattered ray removing grid for removing scattered rays from said object at a spatial sampling interval, comprising:

a step of selecting between removal and nonremoval of a stripe pattern originating from said scattered ray removing grid from said image by image processing, wherein the selection is performed in accordance with a magnitude of contrast of said stripe pattern; and

a step of removing said stripe pattern by image

processing in accordance with the selection.

48. A design method of designing at least one of a sensor and a scattered ray removing grid used for an apparatus for spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using said sensor and said scattered ray removing grid for removing scattered rays from said object, comprising:

determining at least one of an interval of elements of said scattered ray removing grid and said spatial sampling interval of said sensor such that a spatial frequency of a stripe pattern, in said image, which originates from said scattered ray removing grid becomes not less than $1/3$ and not greater than 40% of a sampling frequency that is a reciprocal of said spatial sampling interval.

49. A design method of designing at least one of a sensor and a scattered ray removing grid used for an apparatus for spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using said sensor and said scattered ray removing grid for removing scattered rays from said object, comprising:

determining at least one of an interval of elements of said scattered ray removing grid and said spatial sampling interval of said sensor such that a spatial frequency that is a reciprocal of said interval of elements

of said scattered ray removing grid is within $f_s(n+1/3) \sim f_s(n+0.4)$ or $f_s(n+0.6) \sim f_s(n+2/3)$, where $1/f_s$ is said spatial sampling interval and n is an integer not less than 0.

5 50. A radiographic apparatus, comprising:

a sensor for spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object; and

10 a grid for reducing scattered radiation from said object,

wherein a sampling frequency F_s of said sensor as a reciprocal of the spatial sampling interval and a spatial frequency F_g of said grid as a reciprocal of an interval
15 of shades of elements of said grid on an image-receiving surface of said sensor substantially satisfy $F_g = j \cdot F_s/3$, where j is a positive integer except for multiples of three.

51. The apparatus according to claim 50, wherein the frequency F_s falls within a range of 5 to 10 cyc/mm, and
20 j is two.

52. The apparatus according to claim 50, further comprising an image processing unit for removing an image component originating from said grid from the image.

53. The apparatus according to claim 50, wherein said
25 sensor has a pixel adding function of multiplying the spatial sampling interval by a natural number except for a multiple of three.

54. The apparatus according to claim 50, wherein said sensor is a direct sensor for directly converting the radiation transmission distribution into a charge distribution.

5 55. The apparatus according to claim 50, wherein said sensor is an indirect sensor for converting the radiation transmission distribution into a light intensity distribution by using a phosphor and converting the light intensity distribution into a charge distribution.

10 56. The apparatus according to claim 50, wherein the frequency F_s and the frequency F_g substantially satisfy

$$\frac{\|j_1 F_s - F_g\| - \|j_2 F_s - 2F_g\|}{\frac{1}{3} F_s} \leq 0.05$$

with j_1 and j_2 being so selected as to satisfy $|j_1 F_s - F_g| < F_s/2$ and $|j_2 F_s - 2F_g| < F_s/2$.

15 57. A radiographic method of spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval by using a sensor and a grid for reducing scattered radiation from said object, and acquiring an image of said object, comprising:

20 acquiring an image of said object such that a sampling frequency F_s of said sensor as a reciprocal of the spatial sampling interval and a spatial frequency F_g of said grid as a reciprocal of an interval of shades of elements of said grid on an image-receiving surface of said sensor

25 substantially satisfy $F_g = j \cdot F_s/3$, where j is a positive integer except for multiples of three.

58. The method according to claim 57, wherein the frequency F_s falls within a range of 5 to 10 cyc/mm, and j is two.

59. The method according to claim 57, wherein the frequency F_s and the frequency F_g substantially satisfy

$$\frac{\|j_1 F_s - F_g\| - \|j_2 F_s - 2F_g\|}{\frac{1}{3} F_s} \leq 0.05$$

with j_1 and j_2 being so selected as to satisfy $|j_1 F_s - F_g| < F_s/2$ and $|j_2 F_s - 2F_g| < F_s/2$.

60. A design method of designing at least one of a sensor and a grid used for a radiographic apparatus for spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using said sensor and said grid for reducing scattered rays from said object, comprising:

15 determining at least one of the spatial sampling interval of said sensor and an interval of elements of said grid such that a sampling frequency F_s of said sensor as a reciprocal of the spatial sampling interval and a spatial frequency F_g of said grid as a reciprocal of an interval of shades of elements of said grid on an image-receiving surface of said sensor substantially satisfy $F_g = j \cdot F_s/3$, where j is a positive integer except for multiples of three.

61. A radiation image acquisition apparatus, comprising:
a sensor for spatially sampling a radiation
25 transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said

object; and

a scattered ray removing grid for removing scattered rays from said object,

wherein an interval of elements of said scattered ray removing grid is set such that a spatial frequency of a stripe pattern, in said image, which originates from said scattered ray removing grid becomes not greater than 40% of a sampling frequency that is a reciprocal of said spatial sampling interval.

62. The apparatus according to claim 61, wherein the spatial frequency of the stripe pattern becomes not less than 25% of the sampling frequency.

63. The apparatus according to claim 61, wherein the spatial frequency of the stripe pattern becomes not less than 30% of the sampling frequency.

64. A radiation image acquisition method of spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using a sensor and a scattered ray removing grid for removing scattered rays from said object, comprising:

setting an interval of elements of said scattered ray removing grid such that a spatial frequency of a stripe pattern, in said image, which originates from said scattered ray removing grid becomes not greater than 40% of a sampling frequency that is a reciprocal of said spatial sampling interval.

65. The method according to claim 64, wherein the spatial frequency of the stripe pattern becomes not less than 25% of the sampling frequency.

66. The method according to claim 64, wherein the spatial
5 frequency of the stripe pattern becomes not less than 30% of the sampling frequency.

67. A radiation image acquisition apparatus, comprising:
a sensor for spatially sampling a radiation
transmission distribution of an object to be imaged at a
10 spatial sampling interval and acquiring an image of said
object; and

a scattered ray removing grid for removing scattered
rays from said object,

wherein an interval of elements of said scattered ray
15 removing grid is set such that a spatial frequency that is
a reciprocal of said interval of elements of said scattered
ray removing grid is within $f_s(n+0.25) \sim f_s(n+0.4)$ or
 $f_s(n+0.6) \sim f_s(n+0.75)$, where $1/f_s$ is said spatial sampling
interval and n is an integer not less than 0.

20 68. A radiation image acquisition apparatus, comprising:
a sensor for spatially sampling a radiation
transmission distribution of an object to be imaged at a
spatial sampling interval and acquiring an image of said
object; and

25 a scattered ray removing grid for removing scattered
rays from said object,

wherein an interval of elements of said scattered ray

removing grid is set such that a spatial frequency that is a reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+0.3) \sim fs(n+0.4)$ or $fs(n+0.6) \sim fs(n+0.7)$, where $1/fs$ is said spatial sampling interval and n is an integer not less than 0.

69. A radiation image acquisition method of spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using a sensor and a scattered ray removing grid for removing scattered rays from said object, comprising:

setting an interval of elements of said scattered ray removing grid such that a spatial frequency that is a reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+0.25) \sim fs(n+0.4)$ or $fs(n+0.6) \sim fs(n+0.75)$, where $1/fs$ is said spatial sampling interval and n is an integer not less than 0.

70. A radiation image acquisition method of spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using a sensor and a scattered ray removing grid for removing scattered rays from said object, comprising:

setting an interval of elements of said scattered ray removing grid such that a spatial frequency that is a reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+0.3) \sim fs(n+0.4)$ or

$f_s(n+0.6) \sim f_s(n+0.7)$, where $1/f_s$ is said spatial sampling interval and n is an integer not less than 0.

71. A design method of designing at least one of a sensor and a scattered ray removing grid used for an apparatus for
5 spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using said sensor and said scattered ray removing grid for removing scattered rays from said object, comprising:

10 determining at least one of an interval of elements of said scattered ray removing grid and said spatial sampling interval of said sensor such that a spatial frequency of a stripe pattern, in said image, which originates from said scattered ray removing grid becomes
15 not greater than 40% of a sampling frequency that is a reciprocal of said spatial sampling interval.

72. The method according to claim 71, wherein the spatial frequency of the stripe pattern becomes not less than 25% of the sampling frequency.

20 73. The method according to claim 71, wherein the spatial frequency of the stripe pattern becomes not less than 30% of the sampling frequency.

74. A design method of designing at least one of a sensor and a scattered ray removing grid used for an apparatus for
25 spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval and acquiring an image of said object using said sensor and

said scattered ray removing grid for removing scattered rays from said object, comprising:

determining at least one of an interval of elements of said scattered ray removing grid and said spatial
5 sampling interval of said sensor such that a spatial frequency that is a reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+0.25) \sim fs(n+0.4)$ or $fs(n+0.6) \sim fs(n+0.75)$, where $1/fs$ is said spatial sampling interval and n is an integer not less than
10 0.

75. A design method of designing at least one of a sensor and a scattered ray removing grid used for an apparatus for spatially sampling a radiation transmission distribution of an object to be imaged at a spatial sampling interval
15 and acquiring an image of said object using said sensor and said scattered ray removing grid for removing scattered rays from said object, comprising:

determining at least one of an interval of elements of said scattered ray removing grid and said spatial
20 sampling interval of said sensor such that a spatial frequency that is a reciprocal of said interval of elements of said scattered ray removing grid is within $fs(n+0.3) \sim fs(n+0.4)$ or $fs(n+0.6) \sim fs(n+0.7)$, where $1/fs$ is said spatial sampling interval and n is an integer not less than
25 0.
